

Demonstration to the Operators (Close Coupled Systems)

1. Turn main disconnect on the panel to the on position.
2. Close all drain valves, pulper and silver-saver.
3. Close pulper and chute lids.
4. Release the latch on the stop button. (Explain the 'pre-fill' for the system)
While the pulper is pre-filling instruct them on what can be put into the equipment; all food waste, paper products, cooked bones, Styrofoam and some small plastic. Also explain what not to put into the system, like metal (silverware), glass, rags anything that would be considered non-pulpable.
5. Instruct on feeding; not to put food waste into the trough without the system turned on and the return flow coming down the trough to push the waste into the pulper. Do not 'slug feed' the system. (Dumping large quantities of waste at one time, the system is designed for steady continuous feeding.)
 1. After they have put the last of the waste into the system tell them to let it run for a minimum of 10 minutes after the last waste is fed before pushing the stop button to turn the system off.
 2. If the unit is equipped with a rinse system they should turn the selector switch to "Empty" and let the machine time out.
7. Turn the main disconnect off.
8. Open the pulper lid and scoop out any of the floatables left.
9. Open the drain valves at the pulper and silver-saver.
10. With a hot water hose and toilet bowl brush clean the inside of the pulper. Make sure that the underside of the lip is cleaned. Remove any waste and non-pulpables left in the bottom of the pulper.
11. Remove the access door from the extractor, using the hot water hose and brush clean the inside of the extractor shell and screen.
12. Have the operators start and shut down the system to insure they understand the proper procedures.
13. Have the managers and operators sign the start-up form and turn the system over to them.
14. Wish them happy pulping!
