

Performance Tips and Tricks

For long term shut down of a remote system

1. Run the system until no waste comes out the extractor. (Aprox. 15 to 20 min)
2. Use styrofoam and run through pulper.
3. Run until no styrofoam is left in pulper tank and once again none is exiting the extractor.
4. **Turn power off.**
5. Drain pulper tank and clean any waste left in bottom of tank. Wash the interior of the pulper shell with a brush taking care to clean the underside of the upper shell flange.
6. Open extractor chute and clean plug area as best as possible, this should be wet styrofoam at this time. Remove Styrofoam from plug area.
7. Open the inspection door of extractor and wash the screen and walls of the extractor shell. A toilet brush is ideal for reaching the back of the screen.
8. At the pulper remove the standpipe by unthreading the vertical 12" nipple from the elbow near the base of the tank. Clean and reinstall.
9. Add 6 to 8 oz of Somat Neutro Plus to the trough, fill and run the system, let circulate for a few minutes. (The extra Neutro Plus may cause some foaming.)
10. **Turn the power off**, open the drain, clean the plug area again at extractor.
11. Wipe down the exterior of the equipment.
